The methods increase the nutritional content of seeds without detrimental side effects such as allergenicity or anti-nutritional quality. The nutritional content of the seeds is increased whilst maintaining a high yield. The amount of preselected amino acid in the seed is increased at least 10-20% by weight to about 10 times greater compared to a corresponding untransformed seed. The present sequence represents a chimeric gene construct produced in the construction of the HT12 gene, which is derived from the barley (Hordeum vulgare) alpha hordothionin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               used to grow seeds, especially cereals, that have an endosperm with an increased content of the preselected amino acid, and therefore having an increased nutritional value. The transformed cereals can be used in feed formulations for animals. Transforming plants to have an elevated level of a preselected amino acid in the endosperm of its seed is advantageous in production of feed formulations. Feed formulations currently require
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                                                                                                                                                                                                              The present sequence represents a recombinant DNA molecule of the invention. It comprises, in this order, a maize promoter, and a maize haprobacterium isopentenyl transferase (ipt) gene fragment, and a maize terminator. The DNA molecules of the invention comprise a genetic construct consisting of a promoter directing temporal and/or spatial gene expression in plant seed operatively linked to a cytokinin modulating gene. The recombinant DNA molecules are useful for producing fertile, transgenic plants capable of regulated expression of a cytokinin modulating gene in developing seeds. They are also useful for improving stress tolerance and yield stability in plants. The preferential expression of recombinant DNA molecules of the invention occurs about 14-25 days after pollination. The transgenic plants thus produced have enhanced levels of cytokinin expression exhibit improved seed size, decreased tip kernel abortion and increased seed set during unfavourable
                                                                                                                                                                                               Sequence

```

```
The invention relates to the production of immunoglobulins in plants, wherein at least a portion of the glycans attached to the immunoglobulins lack fucose. The immunoglobulins produced can be of any class (i.e., IgG,
                                                                                                                                                                                                                                                                                                                                                                                                                                          3'UTR

cc antibody. The invention also relates to constructs, plasmids and vectors for producing the immunoglobulins; transformed plant cells, calli, plant tissues and whole plants for producing the immunoglobulins; methods for producing the immunoglobulins. The immunoglobulins thus produced; and the use of such immunoglobulins. The immunoglobulins of the invention may be used to treat HSV infection or tumour anglogenesis. The invention comprovides the advantages of antibody production in plants, such as large scale production, reduced costs, and elimination of pathogenic contaminants such as viruses and prions, with a simplified (i.e., non-comminants such as viruses and prions, with a simplified (i.e., non-comminants) glycosylation profile which reduces the risk that the immunoglobulin may not be functional in animals. The present sequence represents the plasmid pDAB8505, which contains codon optimised DNA sequences encoding the heavy and light chains of the human anti-HSV1/HSV2 menoclonal IgA antibody HX8 each of which are fused to mouse leader sequences. Both heavy and light chain fusion genes are under the control of maize enclosperm-specific gamma-zein promoters. The plasmid also contains a phosphinothricin acyltransferase (PAT) gene under the control
                                                                                                                                                                                         rice actin promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antibody or an anti-alphaVbeta3, alphaVbeta5 dual integrin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC differentiating between haematopoietic cell proliferative disorders
CC associated with at least 1 gene and/or their regulatory regions in a
CC subject. The method comprises contacting a target nucleic acid in a
CC biological sample obtained from the subject with at least 1 reagent,
CC which distinguishes between methylated and non-methylated CpG
CC dinucleotides within the target nucleic acid. ABZ09861 to ABZ1118
CC represent specifically claimed nucleotide sequences from the present
CC invention. Oligonucleotides from the present invention can be used: for
CC differentiating between healthy haematopoietic cells and proliferative
CC disorder haematopoietic cells; for differentiating between acute
CC disorder haematopoietic cells; for differentiating between acute
CC dipphocytic leukaemia and acute myelogenous leukaemia; as probes for
CC determining the cycosine methylation state and/or single nucleotide
CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for
CC determining the cycosine methylation state and/or single nucleotide
CC related sequences and their complements; and as primers for the
CC amplification of haematopoietic cell proliferation can also
CC be used for detecting a predisposition to, differentiation between
CC be used for detecting a predisposition to, differentiation between
CC be used for detecting a predisposition to, differentiation between
CC disorders allowing for improved and informed treatment of patients

/note="Organ: immature ears; Site_1: Xba I; Site_2: Xba I;
The vector was digested with XbaI and one nucleoTide was added by fill in in the recessive 3' end. The genomic DNA was nebulized, end repaired, adaptor ligated and size fractionated using sephadex. The resulting fragments were between 0.8 and 3 kb and were cloned into the vector (:x/y reads in Ml3mp19, .b/g reads in pUC19). The same ligation was transformed into DH5a."

/note="Vector: pHOS1; Site 1: Bst 1; Constructed at The
Institute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from broth cultures of E. histolytica
using a method described by Clark and Diamond (Clark,
C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a
method for isolate identification. Exp. Parasitol.
77:450.). The DNA was mechanically sheared to give a
tight size distribution (~2 kb). The v + i method used for
the library construction is described in detail in Smith,
H.O. and Venter, J.C. (Making small insert libraries for
whole genome shotgun sequencing projects. In Genome
Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barell, Oxford University Press, 1999)."

/note="Vector: pHOS1; Site 1: Bar I; Constructed at The Institute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from broth cultures of E. histolytica using a method described by Clark and Diamond (Clark, C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

Determination of this BAC-end sequence was carried out as part collaboration with the Berkeley Drosophila Genome Project (BDG The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and
                                                                                                                                                                                                                                                              Drosophila melanogaster

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; on bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Similarity

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
